

For each given piece of information below, calculate the pH and pOH.
Use the space below the question for your work.
(Each is from a water solution at 25 °C.)

pH and pOH Calculations

1. $[H_3O^+] = 0.01 \text{ M}$

a. pH = 2

b. pOH = 12

$$\text{pH} = -\log(0.01 \text{ M})$$

$$\text{pH} = -(-2)$$

$$\text{pH} = 2$$

$$\text{pH} + \text{pOH} = 14$$

$$2 + \text{pOH} = 14$$

$$\text{pOH} = 12$$

2. $[OH^-] = 0.00020 \text{ M}$

a. pH = 10.3

b. pOH = 3.70

$$\text{pOH} = -\log(0.00020 \text{ M})$$

$$\text{pOH} = -(-3.70)$$

$$\text{pOH} = 3.70$$

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} + 3.70 = 14$$

$$\text{pH} = 10.3$$

3. $[H_3O^+] = 5.0 \times 10^{-7} \text{ M}$

a. pH = 6.3

b. pOH = 7.7

$$\text{pH} = -\log(5.0 \times 10^{-7} \text{ M})$$

$$\text{pH} = -(-6.3)$$

$$\text{pH} = 6.3$$

$$\text{pH} + \text{pOH} = 14$$

$$6.3 + \text{pOH} = 14$$

$$\text{pOH} = 7.7$$

4. $[OH^-] = 0.010 \text{ M}$

a. pH = 12

b. pOH = 2

$$\text{pOH} = -\log(0.010 \text{ M})$$

$$\text{pOH} = -(-2)$$

$$\text{pOH} = 2$$

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} + 2 = 14$$

$$\text{pH} = 12$$

5. Describe in your own words what happens on the molecular level when a strong acid is added to water (that already has a small amount of hydronium and hydroxide ions in it).

When a strong acid is added to water, the protons from the strong acid do several things:

1. They react with the few hydroxide ions to form water.

2. They react with water to form more hydronium ions.

The result will be very few hydroxide ions and a lot of hydronium ions, lowering the pH.
